

## The Centre de recherche du château de Versailles selects Polaris OS to collect and analyse research data

**October 1st 2020, Paris, France** – Research management tech provider [MyScienceWork](#) is pleased to announce that the [Centre de recherche du château de Versailles \(CRCV\)](#), will be implementing their new analytical and data browsing platform [Polaris OS](#) as part of their research programme.

In the context of the research programme "[Networks and Sociability in French Court during the 17th and 18th centuries](#)", CRCV is attempting to understand the networks that were woven within the court. Centred around studying the listing of offices, their history and their method of transmission, CRCV researchers seek to understand both the mechanisms of social ascent and the hierarchical structures of royal houses.

The data constitute lists of charges of the royal houses of the French court and the succession of their holders, supplemented by biographical information and the different types of links that existed between people. MSW was chosen to ensure that the collected prosopographical data within the research program is captured, searched and analyzed, with the aim of studying and visualising the networks at the court.

“As a French based tech company empowering global innovation, MyScienceWork is proud to be a part of strengthening domestic research”, said Managing Director Yann Mahé. “By leveraging our technological and functional expertise, deep knowledge of research infrastructures, and heritage of innovation and quality, MyScienceWork will play a critical role in the assembling of 17th-18th century French history”.

### About MyScienceWork

MyScienceWork is a technological company committed to accelerating research, optimizing funding and avoiding duplication of research. MSW provides a suite of advanced data-driven solutions for research institutions, scientific publishers and private-sector R&D companies. This includes scientific communication tools and services, [Sirius](#) - an AI powered research analytics solution for governing bodies and [Polaris OS](#) - an open source, highly customisable data driven solution for digital asset management (versatile in its use as a library management system, multimedia archive, research data repository or institutional repository).

### Polaris OS

AI powered [Polaris OS](#) by [MyScienceWork](#) is a completely new repository approach. Designed using the latest technologies, it supports complex functions for users with little to no programming skills and was developed to accommodate and simplify the integration of developments.
